Physics

Water boils at 100 degrees Celsius at sea level. The speed of light in a vacuum is 299,792,458 metres per second. Light from the Sun takes a little over 8 minutes to reach the Earth.

The solar system

The solar system has eight planets. Jupiter is the largest planet. The planet closest to the Sun is Mercury. The Earth takes about 365 days to go once round the Sun.

Life and chemistry

James Watson and Francis Crick described the double helix structure of DNA in 1953. Plants use photosynthesis to turn light, water and carbon dioxide into sugars and oxygen. Carbon has the atomic number 6.
